Project Overview

DKT is the leader in reproductive health and family planning, and is always looking to bring new innovative products into the market to meet the needs of men and women in their reproductive age. In addition to providing accessible and affordable contraceptives, DKT is also engaged in HIV/AIDS prevention, information, and educational programs centered on family planning, and reproductive health, as well as training of healthcare providers.

For their numerous products, DKT utilizes Shopify as one of their sales outlets, and DKT also utilizes SAP Business One for their other business processes. To make their sales processes through Shopify run efficiently, it would be vital to integrate their SAP Business One data with their Shopify data, and Linkbox makes that possible.

The Linkbox system will be the tool for integrating the data between SAP Business One, and Shopify. These data include the Item Master Data, the generated documents (Sales Order, A/R Invoice), and Inventory tracking.

Scope

SRS #	Module	Scope Items
1.0	Item Master Data	- The system allows to: ✓ Retrieve the Item Master Data list from SAP Business One. ✓ Convert the Item Master Data into a JSON format and send into Shopify. ✓ Synchronize the Item Master Data with Shopify.
2.0	Sales Order	- Once an order is made through Shopify, a Sales Order document would be generated. - When a Sales Order document has been generated, this module will send it to SAP, wherein it will be posted as a new Sales Order.
3.0	A/R Invoice	Once a delivery has been recorded as successful, an A/R Invoice document would be generated. The A/R Invoice document would then be sent to the Business Partners.
4.0	Inventory	This module updates the inventory count of specific items/products when they are transacted.
5.0	Configuration	- This module allows the user to configure the following setups: ✓ SAP ✓ Addon ✓ Path ✓ Field Mapping
5.1	SAP Configuration	- This allows the user to configure the setup of SAP, and to do the following: ✓ Add and Update SAP setup. ✓ Activate or Deactivate a particular SAP setup. - The following are the required fields to add a new SAP setup: ✓ SAP Code ✓ DB Version ✓ Server Name ✓ IP Address ✓ SAP Port ✓ Database Name ✓ Database User

		✓ Database Password ✓ SAP User ✓ SAP Password
5.2	Addon Configuration	• This module allows the user to configure the Addon setup, and to do the following: ✓ Add and Update Addon setup. ✓ Activate and Deactivate a particular Addon setup. • This requires the user to provide the following information to add a new Addon setup: ✓ Addon Code ✓ Server Name ✓ IP Address ✓ Database Name ✓ Database User ✓ Database Password • If the user selects an Addon Server, the user is not required to provide the port details. However, when the user selects a SAP server, this will require the user to provide the port details.
5.3	Path Configuration	• This module allows the user to configure the Path setup and to do the following: ✓ Add and Update Path setup. ✓ Activate and Deactivate a particular Path setup. • To add a new Path setup, the user will be required to provide the following: ✓ Path Code ✓ File Type • This allows the system administrator to set a Backup Path. • To add a new Backup Path, the user will be required to provide the following: ✓ Local Path ✓ Remote Path • If the user chooses Local Path, they'll be required to select a particular path on their own specific folder.

		- If the user chooses Remote Path, the user will be required to provide the following: ✓ Remote Path ✓ Remote Server Name ✓ Remote IP Address ✓ Remote Port ✓ Remote User ✓ Remote Password
5.4	Field Mapping Configuration	- This module allows the user to map the field on SAP and on the Addon. This requires the user to do the following actions: ✓ Add and Update field set-up. - The following information will be required add a new Field Map setup: ✓ Field Mapping Code ✓ Field Mapping Name ✓ Path Code ✓ Addon Code ✓ SAP Code ✓ Module - This allows the user to add new Field Map setups of the following.: ✓ Header ✓ Row - This requires the user to do the following actions to add new field on header or row: ✓ Input table name ✓ Select SAP field ✓ Select Addon field ✓ Select Data Type ✓ Set if it is required or not - This allows the system administrator to remove specific field on row and header set up. - This requires the system administrator to have a field mapping set up before to set up header and row.
6.0	API Maintenance	- This module allows the user to view and edit the following API connection details: ✓ License Server ✓ Server ✓ DB Username

		✓ DB Password ✓ Company Database ✓ SAP Username ✓ SAP Password ✓ Server Type
7.0	Manual Uploading	• This module allows the user to manage the manual uploading and to do the following actions: ✓ Select particular transactions to be posted ✓ Check data for uploading ✓ View data summary and error logs

Assumptions

a) Technology

- i. Linkbox will be linked to SAP 9.3 PL 6.
- ii. With the assumption of the amount of data to be uploaded and retrieved, and the frequency of synchronization being once a day, internet connection speed should at least be 20Mbps.

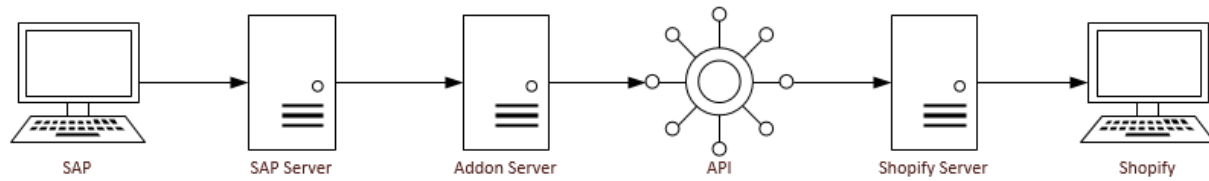

Server Component	
Processor	Dual Six Core, Dual Eight Core, or higher
Operating System	Microsoft® Windows Server 2012 32Bit/64Bit Standard/Enterprise Edition Microsoft® Windows Server 2012 32Bit/64Bit R2 Standard/Enterprise Edition
Memory	34GB or higher
Storage	RAID 10 Four units of 1TB hard disks
Peripherals	UPS/AVR – 3 KVA

b) Business & Standards

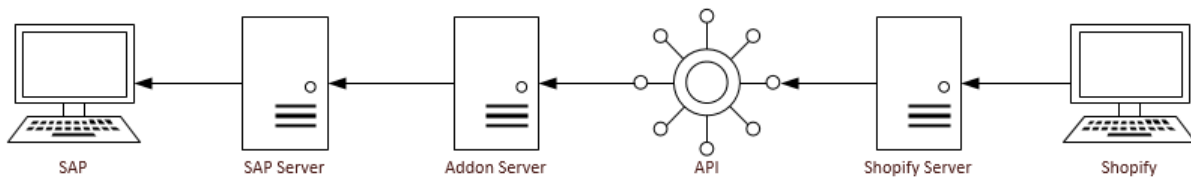

- i. The Sales Order and A/R Invoice documents would be coming from Shopify.
- ii. Deliveries and Payments will be performed by third-party companies.
- iii. For the uploading of the Item Master Data, all fields and parameters pertaining to the products/items will be following the Shopify standards.
- iv. Returns will be done manually through SAP.

Network Diagram

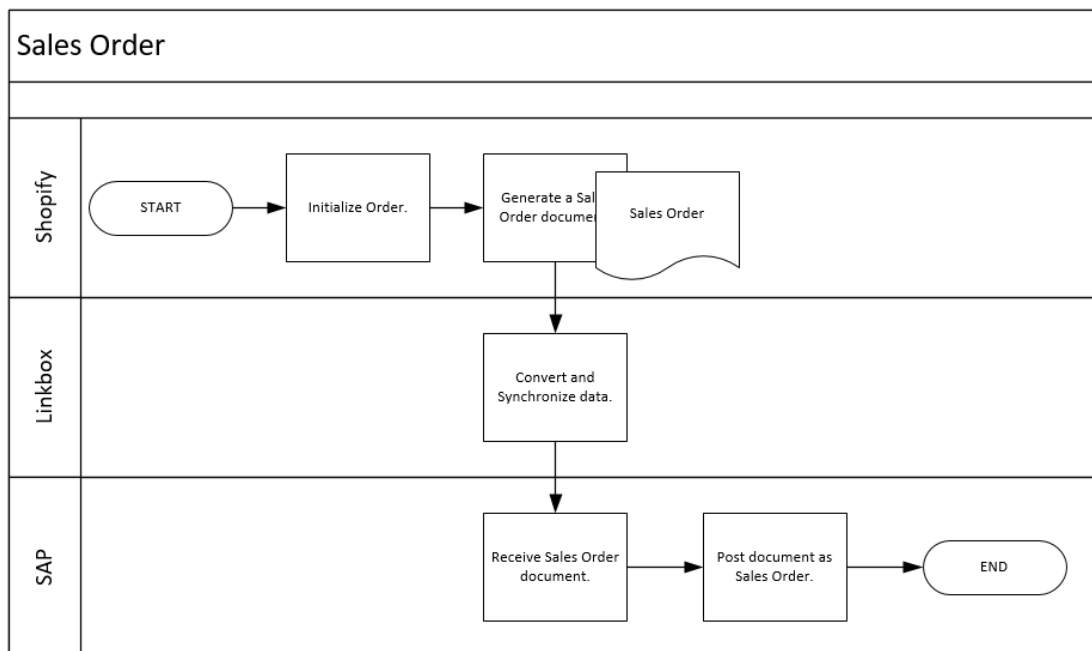

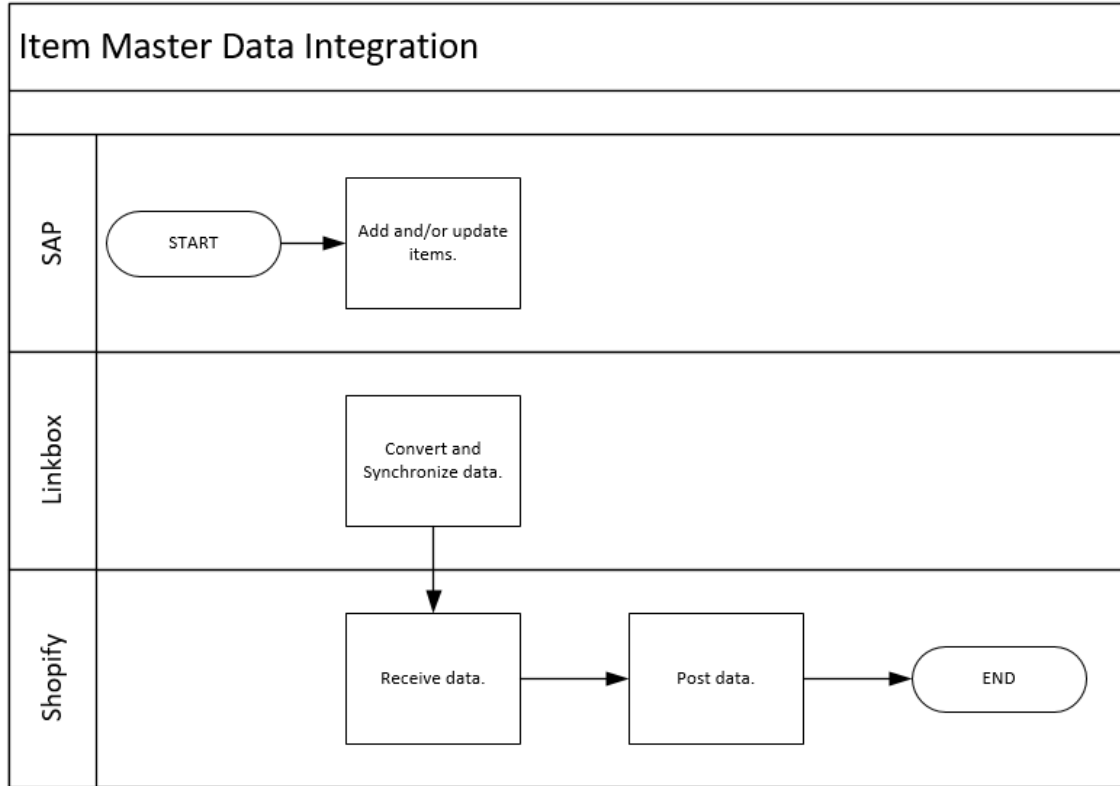

- Data from SAP to Shopify
